

Banner Health Provides Fast, Safe Telehealth Services

Banner Health, a nonprofit health system, worked closely with Intel and the telehealth technology company VeeOne Health to rapidly develop a solution and transform nearly 1,000 in-room televisions into virtual care endpoints. The solutions—which combine advanced telehealth software from VeeOne Health and small-compute hardware from Intel— are being deployed in all 28 Banner Health acute-care hospitals and emergency rooms, enabling staff to provide fast, safe, and effective patient care. Because of the small size of the solutions, deployment was extremely fast and easy, with each installation requiring just a few hours. The combination of innovative technologies, make it possible for Banner Health and other healthcare providers to reduce costs while providing better, safer care.

“Being able to deploy small, powerful Intel-powered solutions on our existing in-room TVs saved us a great deal of time and money in the midst of the COVID-19 crisis.”

Jim Roxburgh, CEO, Banner Telehealth
