

# phoenixNAP Works with Intel to Launch New Cloud Services

phoenixNAP's Data Security Cloud offers customers a single interface for managing the infrastructure, with simplified firewall, storage and server set-up. A range of security tools is included, including a security information and event management (SIEM) system and antivirus in the operating systems for the virtual machines. Threat management, logging and alerting tools are applied across the multitenant cloud environment. The solution is based on Supermicro servers including Intel® Xeon® Scalable processors with Intel® Advanced Encryption Standard New Instructions (Intel® AES-NI) which enables some of the compute-intensive steps of AES encryption to be accelerated in hardware. Intel® Trusted Execution Technology (Intel® TXT) and trusted platform module (TPM) are used to enable phoenixNAP's customers to run more secure environments with Zero Trust policies.

“Intel provides CSPs with the ultimate solutions for their business, but it’s not just about the technology. The company also backs it up with ideas and marketing support to help CPS to build their business, and find new customers.”
